Pandas

Introduction to Pandas :-

- Pandas is python library designed to work with data sets - It offers robust tools for analyzing, cleaning, exploring, and manipulating data.

- The name "pandas" is derived from "Panel Data" and "python Data Analysis", and it was created by Wes Mckinney in 2008.

Why Use Pandas?

- Enables analysis of large datasets to draw conclusions based on statistical reasoning.

- Capable of cleaning messy datasets, transforming them into readable and relevant formats - critical in data science workflows.

Core Capabilities :-

- Pandas helps answer essential data-related questions :- like,

  * Correlations between columns.

  * Statistical metrics like average, maximum, and minimum values.

  * Data Cleaning, such as removing rows with missing or irrelevant values (e.g. empty or NULL entries)
